The layout of my web site was chosen with the criteria of the question in mind regarding the high likelihood of the user suffering from attention and vision deficiencies. A blue background with yellow writing seemed to be the easiest to read and the font Comic-Sans Ms gives the website a funky and fun feel to it. I tried to keep the paragraphs short and used images where possible but kept in mind that bandwidth was also an issue so kept the number of images to a minimum per web page.

The user can easily navigate the website using the headers at the top of each page, this is explained on the home page. I used a large and easily readable font for the user to allow them to engage in the material with little to no struggle. For a simplistic website like this, I focused mainly on html and CSS. I used some JavaScript for the maths page, but I did not use Php as I felt it to be unnecessary. I used a mixture of inline CSS but most it was using an external CSS file. This allowed for slight adjustments to some elements of my page.

I feel like this website is highly accessible and provides students with a brief but detailed description of each topic. It is easy to navigate and user friendly.
